

Instructions

Hi! Thanks for helping us test our photo book program!

During this experiment you will work with our ePic software using either keyboard/mouse or multimodal input. The experiment will consist of two identical parts. In each part you will use one of the two previously mentioned input methods. Each part consists of three sections:

Familiarization

In this session, you will have the opportunity to play with the program to familiarize yourself with the components. Throughout this part, you can always ask questions if anything is unclear to you.

Testing

This session is where we are actually interested in seeing how well our program performs. We will provide you with a set of screenshots that we would like you to replicate on your screen. While you are working on the task, two experimenters will be in the room taking notes. They will help with technical issues but will not help with any task related problems you may have. You do not have to hurry to solve the task, but try to stay on track. **Importantly, we are testing the software, we are not testing you!**

Upon task completion, please notify the experimenters.

Questionnaire

After completing the task, you will be asked to fill in a short questionnaire indicating your satisfaction with the software.

After going through these three stages, we will repeat them again with the second interface. If you are done reading these instructions please inform the experimenters!
